# PREVENTION

*Powered by The Sanctuary*

Sanctuary Prevention is a 2-product solution that addresses – “Turf Quality” and “Soil Health.” Sanctuary Prevention addresses the critical aspect of building microbial life to tired soils. Tired soil is a biological system that has been depleted of its healthy, active microbial system. A microbial system is the life and breath of a healthy soil ecosystem that sustains soil health and turf quality during periods of stress and disease outbreaks. By building soil health, we reduce the many stress and disease related problems that are common to tired biological soil systems.

Sanctuary Prevention delivers a solution that helps to reduce the occurrence of many common agronomic problems. This case contains 2 bio-stimulant products – one for soil health and one for turf quality. These products:

- **Deliver an organic food source to feed and build the native soil microbes. This promotes microbial bio-diversity, a key to promoting a competitive soil ecosystem that positively impacts “Soil Health.”**
- **Add a low pH bio-stimulant to enhance conditions that favor nutrient uptake. This elevated soil microbial population mines and delivers nutrients that are locked in the soil. This system of release enhances a readily available supply of turf nutrients during periods of stress impacting “Turf Quality.”**

This simple approach to turf management is the start to building Soil Health and Turf Quality, which is a major reason for reducing reoccurring agronomic issues. These products are a means to help “Prevent” problems especially during periods of severe weather and stress.

## SANCTUARY ROOT

Root is an energy rich hybrid product derived from traditional and organic ingredients inclusive of plant extracts and composted tea. This product is the nutritional energy to build microbial life that is critical to “Soil Health.”

### BENEFITS

- **Stimulates and Builds Natural Soil Microbes**
- **Enhances Rooting and Soil Structure**
- **Improves Turf Density and Growth**

## SANCTUARY SHOOT

Shoot is a new generation of products that promotes “Induced Systemic Resistance” (ISR) for “Turf Quality.” This product delivers energy to enhance nutrient uptake and the translocation of nutrients within the turf. This approach promotes heat, wear and disease stress resilience. Plus, this product is an outstanding water-buffering agent to lower the water pH in the spray tank. This product extends the tank life of pest control products plus enhances their performance.

### BENEFITS

- **Delivers Energy to Promote Photosynthesis and Carbohydrate Production.**
- **Buffers Water Quality to Enhance Tank Life of Pest Control Products.**
- **Reduces Recovery Time After Aeration, Ball Marks and Stress Problems.**

## DIRECTION FOR USE

These 2 products are applied on a 21 to 30 day interval pending the level of stress or disease pressure. For best results, these products are mixed at 1 gallon per acres in 40 to 50 gallons of water. This will provide for good turf coverage. These 2 products can be safely mixed with other nutrient and pest control products. A simple jar test is recommended to test compatibility. These products are best applied prior to elevated stress and disease pressures. With multiple seasonal applications, the results build to reduce turf stress issues. These 2 products deliver outstanding synergistic results that build “Soil Health and Turf Quality.”
